

## Linear Bush

Fig. 3 Construction of Linear Bush Type LM-UU

A linear-motion system, Linear Bush type LM, incorporating an LM shaft with a plain exterior, provides limitless linear motion. As the load-bearing balls are in point-contact with the LM shaft, the permissible load level is low, but there is little frictional resistance during linear motion. Thus, the Linear Bush provides high-precision, smooth, linear motion.

### Construction and Features

Linear Bush type LM, as shown in Fig. 3, consists of an LM shaft and a bushing sleeve in which raceways are formed into a semi-circular groove. The load-bearing balls are sequentially guided by the retainer, which is formed into one piece with the nut, in the shaft longitudinal direction. The bushing sleeve is made of high-carbon chrome bearing steel. Its interior and exterior are ground after heat treatment.

## Types and Features

### Standard Type

The exterior of the Linear Bush, which is cylindrical in shape, has a plain, high-precision surface. The bush can be put to a wide range of uses.

The Linear Bush comes in the two series' specified below, which are classified by their dimensions.

LM series: Japanese specifications in millimeters;  
widespread use in Japan

Type LM-M: Stainless steel models of the LM series

LME series: European specifications in millimeters;  
widespread use in Europe

### Open Type

This type features a slit as wide as one train of balls ( $50^\circ$  to  $80^\circ$ ) in the bushing sleeve, and is therefore suitable for installation where the LM shaft is supported by pillars or supporting bases. Additionally, this makes clearance adjustment easy.

Types LM-OP and LME-OP

Type LM-MOP

### Sealed Type

The dimensions of this type are the same as those of the standard type. Special synthetic rubber seals are incorporated on one or both sides of the bush so as to prevent the entry of foreign matter and the leakage of grease.

Types LM-UU, LME-UU, and LM-MUU

(Models with a model number containing a "U" have a seal on one side.)

Models of the clearance-adjustable and open types with seals are also available.

### Clearance-Adjustable Type

The dimensions of this type are the same as those of the standard type. The bushing sleeve has a slit in the LM-shaft longitudinal direction. Therefore, when installed in a housing with an adjustable inner diameter, this type eases adjustment of the clearance between the LM shaft and the linear bush.

Types LM-AJ and LME-AJ

Type LM-MAJ

## Long Type LM-L

This type incorporates two retainers of the standard type, and is therefore best suited for locations subject to a moment load. It is useful in reducing assembly man-hours.

Type LM-L: Standard

Type LM-L-UU: Sealed

## Flange Type (round)

The bushing sleeve and flange of the standard Linear Bush are formed into one piece. This type can be bolted directly to a housing, making installation simple.

Type LMF: Standard

Type LMF-M: Stainless steel

Type LMF-UU: Sealed

## Flange Type (square)

The flange of type LMK is cut into a square shape. Compared to the round type, this type has a lower center-line height, making compact designs possible.

Type LMK: Standard

Type LMK-M: Stainless steel

Type LMK-UU: Sealed

### Long Flange Type (round)

This is the longer version of the flange type, with the bushing sleeve and flange formed into one piece. It can be bolted directly to a housing, making installation simple. It incorporates two retainers of the standard type, and is therefore best suited for locations subject to moment load.

Type LMF-L: Standard

Type LMF-L-UU: Sealed

### Long Flange Type (square)

The flange of type LMF-L is cut into a square shape. Compared to the round type, this type has a lower center-line height, making compact designs possible.

Type LMK-L: Standard

Type LMK-L-UU: Sealed

### Flange Type (oval square)

The flange and bushing sleeve are formed into one piece, and the round flange is cut in parallel on two opposing sides. Compared to type LMK, this has a lower center-line height, making compact designs possible. Due to the fact that the two trains of balls bear loads from the flat sides, the service life is extended.

Type LMH: Standard

Type LMH-M: Stainless steel

Type LMH-UU: Sealed

### Long Flange Type (oval square)

Due to the oval-square shape of the flange, this type has a lower center-line height than type LMK-L, making compact designs possible. It incorporates two retainers of the standard type, and is therefore best suited for a location subject to moment load. Due to the fact that the two trains of balls bear loads from the flat sides, the service life is extended.

Type LMH-L: Standard

Type LMH-L-M: Stainless steel

Type LMH-L-UU: Sealed

## LM Casing Unit Type SC

This is a compact aluminum casing unit incorporating the standard Linear Bush. It can be bolted directly to a table, making installation simple.

## LM Casing Unit Type SL (long type)

This is the long version of type SC. The aluminum casing incorporates two Linear Bushes.

B

## LM Casing Unit Type SH

### Universal orientation type

The standard Linear Bush, which is incorporated into the aluminum casing, is smaller and more lightweight than type SC. More compact design is possible with this type than with type SC, and it can be attached in any orientation. Due to the fact that the two trains of balls bear loads from the casing top, the service life is extended.

Type SH-UU: Standard

Type SH-M: Stainless steel

Type SH: Non-sealed

## LM Casing Unit Type SH-L (long type)

### Universal orientation type

This is the long version of type SH. The aluminum casing incorporates two Linear Bushes.

Type SH-L-UU: Standard

Type SH-L-M: Stainless steel

Type SH-L: Non-sealed

## LM-Shaft Support Type SK

This is a supporting base for the lightweight aluminum LM shaft. The slit in the shaft hole enables a shaft to be tightly bolted.

## Notes:

- Linear Bushes of model numbers 50 and below accommodate a retainer made of synthetic resin that does not generate a large amount of noise during operation. If the operating temperature exceeds 80°C, use a model incorporating metal retainers. When specifying a model of this type, append "A" to the model number.

[Ex.] LME20 A

High-temperature symbol

- If a model with seals is required, that fact must be specified.

165		133.7		4.15	116	3	36.3	54	20	-16	7350	16000

- Models with a metal retainer come in the shape shown below.

Type LME-A

- If only one Linear Bush unit is used on each shaft, avoid moment loads. If a moment load is to be applied, use two Linear Bush units on each shaft and mount the bushes so that there is a significant interval between them.

## LM Stroke

Fig. 4 Construction of LM Stroke Type ST

LM Stroke type ST is a high-precision linear-motion system with a very low friction coefficient. It is capable of rotating or reciprocating motion, and of both motions simultaneously.

Type ST is divided into the standard and sealed types, and each type is subdivided into light- and intermediate-duty types. The simple construction of the stroke enables high precision to be achieved at a low price. The stroke's wide range of applications include press die sets, printing-machine ink rolls, punching-press work chucks, press feeders, electric-discharge machine work heads, winder-roll correction devices, textile machinery, strain measuring instruments, optical-measuring-instrument spindles, and various copiers.

### Construction and Features

In stroke ST, as shown in Fig. 1, the cage and balls are incorporated into the cylindrical ST sleeve. The balls are arranged in a staggered pattern so that they bear loads evenly. The cage is made of light alloy, making it lightweight yet highly rigid, and is perforated so as to enable high-speed movement. The ST sleeve is provided with thrust and snap rings on both ends, which prevent the cage from overrunning.

This design enables a composite rotation and reciprocation motion to be achieved with a low friction coefficient. The stroke length can be twice the range over which the cage can move within the sleeve. The maximum stroke length for each model number is specified in its dimension table.

#### Very low friction coefficient

The balls and raceway form point-contacts, which feature the smallest rolling loss of any mode of contact. Moreover, the balls are held by the cage and are isolated from one another, and can therefore roll with a very low friction coefficient ( $\mu = 0.0006$  to  $0.0012$ ).

#### Lightweight and compact

As the ST sleeve consists only of a thin wall and balls, the bearing outer diameter can be kept small. This enables a lightweight, compact design that does not require a large installation space.

#### High precision and low cost

Construction is simple, and machining can be performed easily. This ensures high precision and enables the construction of a sliding system at low cost.

## Types and Features

### Light-duty type ST

This type provides a long stroke. It is designed for light-duty uses.

Shaft diameter: 6 mm to 100 mm

### Intermediate-duty type ST-B

This type features the same dimensions as type ST, but has a shorter stroke. It is designed for intermediate-duty uses, and doubles the load rating.

Shaft diameter: 20 mm to 100 mm

B

### Type STI with an inner cylinder

If your LM shaft cannot be hardened, this type should be used. We will produce the inner cylinder upon receipt of individual orders.

### Sealed Types ST-UU and ST-UUB

Both ends of the ST sleeve are provided with special synthetic rubber seals, which prevent the entry of foreign matter and the leakage of grease.

If it is necessary to reduce the seal resistance, models with felt seals are also available (types ST-DD and ST-DDB).

# Miniature Stroke

Fig. 5 Construction of Miniature Stroke Type MST

Miniature Stroke type MST is a precision rolling bearing using balls. It is capable of providing composite rotation and reciprocation motion.

The cross section is small in size, the clearance is minimal, and the movement is smooth. Thus, the Miniature Stroke is suitable for a wide range of small measuring instruments, including optical-measuring-instrument spindles, pen plotters, office automation equipment, computer terminals, automatic balances, digital length-measuring instruments, and solenoid valves.

## Construction and Features

Miniature Stroke type MST comprises an ST shaft, ball cage, and ST sleeve. These components can be freely combined to your specifications.

### Precision bearing

Precision-grade steel balls (spherical deviation, as specified in JIS B1501, not exceeding 0.0003 mm) incorporated in the copper alloy cage guarantee high precision.

### Highly durable bearing

The ST shaft and sleeve are made of select material, which is heat-treated and ground, and the raceways are finished to ultra-fine smoothness. Though they are densely packed into the cage, the balls are arranged so that their raceways do not overlap each other. The balls therefore remain free from wear for an extended period, making them highly durable.

### Compact bearing

The ball diameter is only 1 mm, and the ST sleeve consists of a thin wall. The cross section is therefore small, making compact designs possible.

If it is necessary that the radial clearance be zero or less, "C1" must be appended to the model number.

[Ex.]

MST5-203080 C1

Indicates that the combined radial clearance is zero or less

Indicates the combination of M5720, S71030, and T580

## Construction and Features

The model numbers of the ball cage, ST sleeve, and ST shaft are specified in the respective dimension tables.

## Die-Set Ball Cage

Die-Set Ball Cage types KS and BS are used primarily as the guide in the guide post of a precision punch-press die set. Their high performance allows high-speed reciprocal movement.

These ball cages are used also in various machines and instruments, including textile machinery, precision measuring instruments, automatic recorders, medical equipment, and machine tools. If the housing cannot be hardened and ground, the Die-Set Ball Cage can be replaced by stroke ST to obtain similar performance.

### Construction and Features

Die-Set Ball Cage types KS and BS comprise lightweight, highly rigid cages accommodating many precision-grade steel balls, as specified in JIS B1501 (spherically relative difference: 0.0005 mm). The balls are arranged spirally on the cage circumference, and the raceways are designed so as not to overlap each other. As a result, the balls remain free from wear for an extended period and are therefore highly durable.

After being precision-finished, the ball pocket that holds the balls in place is prevented from falling off by THK's unique continuous caulking method. Therefore, even if the cage is used in a space longer than that of the housing, smooth movement is not prevented.

### Notes:

- Type BS has a groove on its cage to enable it to be distinguished from other types.
- THK produces shafts for types KS and BS. If you require one of these shafts, contact us.
